

Liquid Lime/Gypsum Application

Soil health impacts fruit quality. Consider calcium's benefits:

OVS liquid lime application

- Improves soil porosity and aeration
- Feeds the soil biology
- Allows for proper root growth
- Improves tissue growth and strengthens the cell wall
- Improves availability and uptake of other nutrients

The limestone is Micronia Ag H2O, 325 mesh particle size.

The gypsum is Diamond K product with 92% passing 325 mesh.

Compare the targeted application of OVS liquid lime to conventional dry lime application drifts.

Improving soil pH with MICRONA AG H2O SOLUTION GRADE

ESTIMATED APPLICATION (Solution Grade)

Correct applications are calculated according to soil type. Depending on material used, this would be in the range of 100 to 350 lbs per acre per year (2 inch profile depth). To overcome acidifying effects of nitrogen fertilizers, two (2) lbs of fine lime (MICRONA solution grade or granular) are needed for each (1) lbs of ammonium nitrate. Crop specific calcium needed for plant growth and subsequent removal from soil must also be considered. High crop yielding soils should not be allowed to drop below 6.2 soil pH as a minimum to ensure fertilizer effectiveness, maximum crop production potential and subsequent highest return of investment.
